INTRODUCTION

The management of personal finances is a critical life skill that directly impacts an individual's quality of life and long-term security. However, in an era of digital payments and one-click purchases, many people find it increasingly difficult to keep an accurate record of their daily spending. This lack of oversight often leads to "lifestyle creep," where unnecessary small expenses prevent individuals from achieving significant savings goals. While the mobile app market is flooded with financial

PROJECT OBJECTIVES

The primary goal of this project is to develop a mobile application that provides meaningful behavioral change and encourages saving. The specific objectives are:

1. To create a frictionless system for tracking daily income and expenses.
2. To design features that identify and reduce unnecessary recurring payments.
3. To implement visual summaries and alerts that improve user financial awareness.
4. To develop a user interface

METHODOLOGY

The User Experience Strategy serves as the foundational pillar where the project's vision is aligned with both user needs and business objectives.

Once the strategy is clear, the Information Architecture phase focuses on organizing, structuring, and labeling content to support findability and usability.

The Behavioral Logic Design pillar defines the interactive nature of the system, transforming static layouts into a living, responsive interface.

RESULTS

The research findings demonstrate that the application significantly optimizes financial management by increasing logging efficiency by 60% through a highly preferred three-tap interface. This streamlined monitoring directly impacts user behavior, identifying that 35% of spending is allocated to non-essential "Wants" and triggering a 22% reduction in immediate expenditures following "Amber" visual alerts. Ultimately, the combination of a simplified UI and mandatory transaction

PROJECT OUTPUT

The following screens show the mobile application interface, providing an overview of all transactions and key features.

CONCLUSION

This project has successfully achieved all five of its Research Objectives (RO), demonstrating both its effectiveness and practical relevance. It has evolved beyond its initial concept as a simple digital ledger into a more impactful behavioral intervention tool, designed to influence and improve users' financial habits. The findings highlight an important principle in money management: less is often more. Rather than overwhelming users with complex features, the project focuses on simplicity, clarity, and ease of use. By offering a tool that is fast, visually intuitive, and encourages reflection, it enables users to better understand their

RECOMMENDATION AND FUTURE WORK

While this approach intentionally empowers individuals to take control of their finances and fosters sustainable habits, future research could explore the integration of machine learning techniques to automate the categorization of expenses into 'Wants' and 'Needs.' For example, location-based data and spending patterns could be leveraged to intelligently classify transactions, reducing user effort while maintaining behavioral insights. Additionally, expanding the pilot study to include a larger and more diverse demographic sample would yield more comprehensive findings. In particular, examining how cultural spending

ACKNOWLEDGMENT (Optional)

My sincere appreciation goes to the Engineering School and the CAU community for their continuous academic inspiration and support in different social and economic contexts. Their commitment to excellence has played a significant role in shaping both this project and my overall academic journey. I am equally grateful to the app's testers for their time, participation, and valuable feedback. The data they provided was instrumental in evaluating the system, identifying areas for
