

Project Updates – IELTS Mock Exam AI System

1. Cost Optimization & Speech Processing

To reduce operational costs while maintaining performance, we migrated speech-to-text processing to a local setup using the **Faster Whisper (base model)**. This approach significantly lowers dependency on external APIs and improves response time due to reduced network latency. The system now processes user audio more efficiently while keeping infrastructure costs under control.

2. Admin Panel Implementation

An administrative dashboard has been introduced to provide centralized control over key system components. The admin panel includes:

- **Writing Module Configuration**
Ability to manage and update topics for both *Task 1* and *Task 2*, ensuring dynamic and diverse exam content.
 - **Text-to-Speech (TTS) Controls**
Options to modify and switch voice models, allowing flexibility in listening exam simulations and improving user experience.
 - **LLM Configuration Management**
Capability to change and fine-tune the Large Language Model used for evaluation and responses, enabling better control over performance, cost, and output quality.
 - **User Management System**
Tools for monitoring users, managing accounts, and maintaining overall system integrity.
-

3. System Recovery & Rebuild

Due to the need for project recovery, the system was rebuilt from scratch. Core functionalities have been re-established with a more flexible and scalable architecture, allowing easier future improvements and integrations.

Upcoming Improvements (Next Phase)

1. System Prompt Optimization

We will focus on refining system prompts, including:

- Evaluation criteria for speaking and writing tasks
- Instruction clarity for AI responses
- Consistency in scoring mechanisms

These improvements aim to align the system more closely with real IELTS assessment standards.

2. Accuracy Enhancement

Improving the reliability and precision of AI-generated evaluations is a key priority. This includes:

- Better scoring logic
- Reduced variability in responses
- More consistent feedback quality

3. User Experience Improvements

Enhancements will be made to ensure a smoother and more intuitive user journey, including:

- Faster response times
- Improved interaction flow
- More natural and helpful feedback
